JAVA PROJECT REPORT ON

Task and Daily Activity Management System

Submitted by

RAMESH R

25BIT044

Under the Guidance of

DHILEEBAN A

Technical Trainer

Technical Department, KG College of Arts and Science

Academic Year: **2025 – 2026**

APRIL 2026 Semester: **II**

DECLARATION

I hereby declare that the project entitled **“Task and Daily Activity Management System ”** submitted in partial fulfillment of the requirements for the course **JAVA PROGRAMMING** is a **record of my original work** carried out under the guidance of , Technical Trainer, Technical Department, KG College of Arts and Science.

I further declare that this project has not been submitted previously, either in part or in full, for the award of any degree, diploma, or other similar title, at this or any other institution.

I have acknowledged all sources of information used in this project wherever applicable.

April 2026

Coimbatore

RAMESH R

(Your Name)

CERTIFICATE

This is to certify that the project entitled **Task and Daily Activity Management System ”** is a **bona fide work** carried out by **[RAMESH R] [I-BScIT-.’A’]**, [], **KG College of Arts & Science**, in partial fulfillment of the requirements for the course **[JAVA PROGRAMMING]**.

This project has been completed under my supervision and guidance during the academic period **April 2026**.

Place: COIMBATORE

Date: 09.04.2026

Submitted for the Viva-Voce Examination held on **KG COLLAGE OF ARTS & SCIENCE**

Guide:
(Technical Trainer, KGCAS)

Head of the Department
(Technical Head, KGCAS)

ABSTRACT

The **Task and Daily Activity Management System** is a Java-based application developed to efficiently manage employee attendance records and handle leave requests in an organized manner. In many organizations, attendance and leave details are often recorded manually or maintained across multiple systems, which can lead to issues such as data duplication, errors in attendance tracking, delays in leave approvals, and difficulty in maintaining accurate records.

This project aims to simplify attendance and leave management by providing an automated system that allows users to store, retrieve, update, and manage employee attendance and leave details easily. The system uses a menu-driven interface that enables users to mark attendance, apply for leave, and view records efficiently, ensuring better organization and quick access to information.

The application is developed using Core Java programming concepts such as classes, objects, methods, loops, conditional statements, and file handling. It is implemented as a console-based application and can be further enhanced using Java Swing to provide a graphical user interface for an improved user experience.

The main objective of the system is to improve operational efficiency, reduce manual effort, and ensure accurate tracking of employee attendance and leave records. The system provides key features such as adding employee details, marking daily attendance, applying for leave, updating records, and viewing reports, making it suitable for small organizations, institutions, and academic projects.

This project demonstrates the practical implementation of object-oriented programming in Java and serves as a foundation for developing advanced systems with features like database integration, biometric attendance systems, real-time monitoring, cloud storage, and enhanced security in the future.

1.INTRODUCTION

In today's digital world, managing employee attendance and leave efficiently is very important for organizations. **The Task and Daily Activity Management System** is a software application developed to store, organize, and manage employee attendance records and leave details in a structured and user-friendly manner.

This project is designed as a simple application that allows users to perform operations such as adding new employees, marking daily attendance, applying for leave, updating records, and deleting unnecessary data. It helps maintain all employee-related information in one place, avoiding common problems of manual record keeping such as data loss, duplication, delays, and difficulty in tracking attendance and leave status.

The system can be implemented as a console-based application using programming languages like Java, Python, or C++. It uses basic programming concepts such as arrays or collections, loops, conditional statements, and functions to perform various operations related to attendance monitoring and leave management.

The main objective of this project is to reduce manual effort and provide quick and accurate access to employee attendance and leave details. The tracking feature allows users to monitor attendance status, while the update feature ensures that records can be modified whenever required.

This project is useful for students, small organizations, and institutions to manage employee attendance efficiently. It also demonstrates the practical application of programming concepts and serves as a foundation for developing advanced systems with features like database integration, graphical user interface, real-time tracking, and cloud storage.

1.1 Objective

The main objective of the Task and Daily Activity Management System is to help users efficiently organize, track, and manage their daily tasks and activities. The system aims to improve productivity by allowing users to prioritize tasks, set deadlines, and monitor progress in a structured manner.

1.2 Overview

The Task and Daily Activity Management System is a software application designed to simplify task management for individuals or small teams. It provides a user-friendly interface

where users can create, update, delete, and view tasks. The system ensures better time management by categorizing tasks and providing reminders for important activities

1.3 Features

- User-friendly interface for task management
- Add, edit, delete, and view tasks
- Task prioritization (High, Medium, Low)
- Deadline and reminder functionality
- Daily activity tracking
- Status update (Pending, In Progress, Completed)
- Search and filter options

2. Program Analysis

2.1 Problem Definition

Managing daily tasks manually can lead to inefficiency, missed deadlines, and poor time management. There is a need for a system that organizes tasks systematically, reduces manual effort, and improves productivity.

2.2 Project Overview

This project provides a digital solution for managing daily activities. It allows users to maintain a structured list of tasks, track progress, and ensure timely completion. The system can be implemented as a desktop or web application.

2.3 Scopes and Limitations

Scope:

- Suitable for students, professionals, and small teams
- Can be extended to include team collaboration features
- Can be integrated with notification systems

Limitations:

- Limited to basic task management features
- No advanced AI-based scheduling
- Requires user input for update
-

3.SYSTEM DESIGN

System design is the stage where the structure and components of the system are planned before the actual implementation. In this phase, the system is divided into different modules, and the workflow of the application is defined. Proper system design helps in organizing the program efficiently and makes development easier.

The **Employee Attendance Monitoring and Leave Management System** is designed as a menu-driven application where users can select food items, enter quantities, and generate a final bill automatically.

The system is divided into several modules to perform specific tasks. Each module is responsible for handling a particular function of the system.

System design defines the structure and working of the system

---

3.1 Modules

- **User Module:** Handles user interactions
- **Task Management Module:** Add, update, delete tasks
- **Reminder Module:** Alerts for deadlines
- **Database Module:** Stores task data
- **Report Module:** Displays task summaries
-

4.METHODOLOGY

Methodology describes the process followed to develop the project. It explains the steps taken from understanding the problem to designing, implementing, testing, and documenting the system.

For the **Employee Attendance Monitoring and Leave Management System** History a structured development approach was followed to ensure that the system meets the requirements and functions efficiently.

The development process includes the following stages:

• Problem Analysis
• System Design
• Program Development
• Testing and Validation
• Result and Documentation

The **Employee Attendance Monitoring and Leave Management System** follows a structured development approach.

4.1 Problem Analysis

The system analyzes user requirements for managing daily tasks efficiently and identifies key features needed for implementation.

4.2 System Design

The system is designed using modular architecture, ensuring each component performs a specific function. Data flow and user interactions are clearly defined.

4.3 Program Development

The system is developed using a suitable programming language with database integration. Coding is done module-wise to ensure clarity and maintainability.

4.4 Testing and Validation

Testing is performed to ensure the system works correctly. Unit testing, integration testing, and user testing are conducted to validate functionality.

4.5 Result and Documentation

The system successfully manages tasks and provides organized outputs. Proper documentation is maintained for future reference.

4.6 Algorithm

1. **Start**
2. **Display menu options**
3. **Accept user choice**
4. **If user selects add task**
    - **Input task details**
    - **Save to database**
5. **If user selects view tasks**
    - **Retrieve and display tasks**
6. **If user selects update/delete**
    - **Modify task accordingly**
7. **Repeat until exit**
8. **Stop**

4.7 Flowchart

Start → Display Menu → User Input →
→ Add Task / View Task / Update Task / Delete Task →
→ Process Action → Display Result →
→ Exit or Repeat → End

5.SOURCE CODE

```
# Task and Daily Activity Management System

tasks = []

def add_task():
    name = input("Enter task name: ")
    desc = input("Enter description: ")
    priority = input("Enter priority (High/Medium/Low): ")
    deadline = input("Enter deadline: ")

    task = {
        "name": name,
        "description": desc,
        "priority": priority,
        "deadline": deadline,
        "status": "Pending"
    }

    tasks.append(task)
    print("Task added successfully!\n")

def view_tasks():
```

```
    if not tasks:
        print("No tasks available.\n")
        return

    for i, task in enumerate(tasks):
        print(f"\nTask {i+1}")
        print(f"Name: {task['name']}")
        print(f"Description: {task['description']}")
        print(f"Priority: {task['priority']}")
        print(f"Deadline: {task['deadline']}")
        print(f"Status: {task['status']}")

def update_task():
    view_tasks()
    if not tasks:
        return

    index = int(input("\nEnter task number to update: ")) - 1

    if 0 <= index < len(tasks):
        status = input("Enter new status (Pending/In Progress/Completed): ")
        tasks[index]["status"] = status
        print("Task updated successfully!\n")
    else:
        print("Invalid task number.\n")
```

```
def delete_task():
    view_tasks()
    if not tasks:
        return

    index = int(input("\nEnter task number to delete: ")) - 1

    if 0 <= index < len(tasks):
        tasks.pop(index)
        print("Task deleted successfully!\n")
    else:
        print("Invalid task number.\n")

def main():
    while True:
        print("\n--- Task Management System ---")
        print("1. Add Task")
        print("2. View Tasks")
        print("3. Update Task")
        print("4. Delete Task")
        print("5. Exit")

        choice = input("Enter your choice: ")
```

```
        if choice == "1":
            add_task()
        elif choice == "2":
            view_tasks()
        elif choice == "3":
            update_task()
        elif choice == "4":
            delete_task()
        elif choice == "5":
            print("Exiting program...")
            break
        else:
            print("Invalid choice! Try again.\n")

# Run the program
main()
```

6.INPUT AND OUTPUT SCREENS

```
--- Task Management System ---
1. Add Task
2. View Tasks
3. Update Task
4. Delete Task
5. Exit
Enter your choice: 1

Enter task name: Study
Enter description: Read Python
Enter priority: High
Enter deadline: Tomorrow
Task added successfully!
```

```
--- Task Management System ---
Enter your choice: 2

Task 1
Name: Study
Description: Read Python
Priority: High
Deadline: Tomorrow
Status: Pending
```

```
--- Task Management System ---
Enter your choice: 3

Enter task number to update: 1
Enter new status: Completed
Task updated successfully!
```

```
--- Task Management System ---
Enter your choice: 2

Task 1
Name: Study
Description: Read Python
Priority: High
Deadline: Tomorrow
Status: Completed

--- Task Management System ---
Enter your choice: 5
Exiting program...
```

7.DISCUSSION & CONCLUSION

7.1 Discussion

The system simplifies task management by providing a structured approach. It reduces manual effort and improves productivity. Users can easily track their daily activities and complete tasks on time.

7.2 Conclusion

The Task and Daily Activity Management System is an effective tool for organizing and managing tasks. It enhances efficiency and ensures better time utilization. Future improvements can include mobile integration and advanced features like notifications and team collaboration.
